Men's Health CHECKLIST

General Health

Annual wellness exam. These visits focus on preventive care and may include vaccinations, screenings to check for
diseases, and education and counseling to help you make informed health decisions. Your height, weight, and body
mass index (BMI) will likely be checked at every wellness visit. Be sure to talk with your healthcare provider about
your diet and physical activity levels. Additional tests and exams may be needed to manage any chronic illnesses you
may have. Your healthcare provider may also check your testicles for lumps, a change in size, and tenderness.
These could be signs of a problem.

Bone mineral density test. Men 70 years old and older should have the test at least once. Men aged 50 to 69 who have risk factors or men who have broken a bone after age 50 should also have the test.

Colorectal Health

Colonoscopy. Men at average risk for developing colorectal cancer should have a colonoscopy at age 50 and then every 10 years. Men with inflammatory bowel disease or a family history of colorectal cancer may need to start screening earlier than age 50 or have screenings more often.

Diabetes

■ **Blood glucose test.** Screening usually starts at age 45 and is normally done every 3 years. Screenings may begin earlier or be done more frequently if you are at risk for diabetes (for example, being overweight or having high blood pressure and/or high cholesterol).

Eye, Ear, and Dental Health

Eyes. At age 40, all adults with no signs or risk factors for eye disease should receive a baseline comprehensive eye evaluation. But see an ophthalmologist before age 40 if you have a preexisting eye disease, a family history of eye disease, or if you have a risk factor for developing one, such as high blood pressure or diabetes. Any man who has visual changes, injury, or other ocular symptoms should also see an ophthalmologist.

Men 65 and over with no risk factors should be examined every 1 to 2 years. This exam should include having your eyes checked for signs of cataracts, age-related macular degeneration, and glaucoma.

For all men, if an eye disease is detected, the frequency of eye exams will vary. Talk with your ophthalmologist about what your schedule should be.

- **Ears.** Talk with your healthcare provider about a hearing test if you are having any issues with your hearing.
- **Dental.** Men should have a dental exam and cleaning every 6 to 12 months unless recommended otherwise.

Heart Health

- **Blood pressure.** Men should have their blood pressure checked once every 2 years beginning at age 20. If your blood pressure is higher than normal (120/80), your healthcare provider may check it more often.
- □ **Cholesterol.** Most men should have their cholesterol checked every 4 to 6 years beginning at age 20. If your healthcare provider thinks you may have an increased risk of heart disease or stroke, he or she may check it more often.
- **Abdominal aortic aneurysm.** A one-time screening is recommended for men 65 to 75 years of age with a history of smoking.

	 Adults need to get shots (vaccinations), too. Ask your healthcare provider if you are up to date with your vaccines. Men 50 years of age and older should get vaccinated to prevent shingles. 							
	Men over 65 should be vaccinat	ed against pneumonia.
